Competitive Advantage Through Cloud Computing November 15, 2011

Cloud Computing in the Era of "Big Data" Business Considerations

James Short Lead Scientist Center for Large-scale Data Systems San Diego Supercomputer Center UC San Diego jshort@ucsd.edu

Agenda

- Overview: Will Cloud be as big as the Internet? (warning label)
- Drivers (no one goes there anymore, it's too busy)
- "Big Data" and Business Analytics (our previous era of little data)
 - How much data? How much information?
 - A report on server capacity and performance
 - Workloads
 - M2M
- Business Considerations for Cloud (time for a reality check)
 - Who owns cloud in your enterprise? Who is responsible for it?
 - Business value assessment
 - Is cloud strategic (an enterprise investment)? Is cloud "virtualization and data center consolidation" (a cost-focused, business unit IT initiative)?
 - Some Early Lessons: Cloud TOP 10 list (business)

Loud Clouds in the Market

Their Saas and a Hole In The Ground?"

Top 55 Cloud Computing Enablers Gaining Mind Share

http://www.cloudtweaks.com/2011/03/top-55-cloudcomputing-enablers-gaining-mind-share-in-1q-2011/ 1. Amazon Web Services (AWS), Elastic Compute Cloud (EC2), Simple Storage Service (S₃), Virtual Private Cloud (VPC), Elastic Beanstalk. Elastic Block Store (EBS), CloudFront. Cloud Formation, CloudWatch 2. Salesforce.com Sales Cloud 2 (CRM), Service Cloud 2 (Support), Force.com (Development Platform), Chatter (Collaboration), Heroku. Database.com. Jigsaw. RemedyForce, AppExchange 3. Google Apps (Web based business applications suite) 4. VMWare (Virtualization management) vCloud Director. vCenter, vSphere 5. Citrix – XenServer (Virtualization), VMLogix 6. Rackspace – Cloud Builders / OpenStack, CloudKick 7. HP - 3PAR, Vertica (Data Analytics) 8. Dell – Boomi (AtomSphere – Cloud Integration) 9. Cisco 10. CA Technologies - 3Tera AppLogic (Turnkey Cloud computing platform)

Rapidly evolving business marketplace

 $\bullet \bullet \bullet$

Vint Cerf, Google:

"No standards"

What Is Cloud?

- Infrastructure provided by a service provider to build and operate Internet applications
- New model of consumption, operations and delivery of IT services
- Cloud categories
 - Software as a Service
 - Infrastructure as a Service
 - Platform as a Service
 - Database as a Service

Why Cloud? Business IT Considerations

- End user focus (ability to directly configure resources)
- Multi-tenancy (shared services)
 - Utilization and efficiency improvements
 - Peak load capacity
 - Centralization of infrastructure components
- Cost
 - Capex converted to operational expense
 - Utility computing pricing (usage based options...)
- Reliability / Scalability / Performance
 - Redundant sites, dynamic provisioning, performance monitoring
- Device and Location independence
 - Users access via web browser anywhere
- Information security / governance
 - Centralization of data, but data is distributed over a wider area and more devices

THE CLOUD COMPUTING ADOPTION MODEL

Cloud Deployment

Public Cloud, Community Cloud, Hybrid Cloud, Private Cloud

Gartner.

"Cloud-ify"

• "Having been at the heart of a major "private cloud" build out for a large multinational company over the last 3 years, I can offer my opinion that "private clouds" are really nothing more than an analogy for "data center consolidation". The truth of the matter is that large corporations are riddled with legacy technologies which is almost impossible to "cloud-ify". Foundational elements such as virtualization, automated provisioning (which I still think nobody in the vendor space has truly cracked) and streamlined work processes are the enablers of better run, more efficient data centers, but "private clouds" they are not. If an organization must continue to bear the capital costs, fixed not variable, then it is hard to make the statement that this is an "on demand" data center. The only true cloud is the one you can pay for with your credit card. You can't do that internally."

Cloud Computing In the Era of Big Data

Big Data - Example Stats

- 30 billion pieces of content were added to Facebook... in the past month
- More than 2 billion videos were watched on YouTube ... yesterday
- The average teenager sends 4,762 text messages per month
- 32 billion searches were performed last month ... on <u>Twitter</u>
- Netflix accounts for 32.7% of peak US downstream traffic

Sources: Gartner, Netflix, CNN, Sandvine

Satellite Telemetry: 1 PB per day, HD full motion video

How Much Surveillance Data? NYT Review of Books says NSA Datacenter will store Yottabytes of data (10²⁴ bytes). The Internet is about 1 Yottabyte.

WAL*MART[®]

Real Time Analytics:

- Everything Wal Mart knows about a customer
- Everything our trading partners know about the customer
- Everything on the public internet about the customer
- Combine it, process it in real time for all customer interactions
- And store it for future use

50 Billion Devices By 2020

Real Time Ad Placement On Social Media Websites

Big Data at Twitter

- Three Challenges
- #1 Collecting Data
 - 7 TB/day, 2+ PB a year
 - 225 GB during this presentation
 - Early DB did not scale, lost data, transitioned to Scribe
- #2 Large-Scale Storage and Analysis
 - How store 7 TB/day (in Hadoop cluster)
 - Analysis at scale (12 billion tweets, 5 mins)
 - Social graph analysis over hybrid DB arrangement

Source: http://www.slideshare.net/ kevinweil/big-data-at-twitter-chirp-2010

Big Data at Twitter

- Three Challenges (continued)
- #3 Rapid Learning Over Big Data
 - Use PIG
 - Counting Big Data
 - How many requests per day
 - Average latency? 95% latency?
 - Response code distribution per hour
 - Searches per day
 - Unique users searching? Unique queries?
 - Geographic differences for queries?
 - Usage differences for mobile users

Scale

- New concepts and practices that use scale
 - Web 2.0, Collective Intelligence, Crowdsourcing
 - Social media, Internet of Things, Wikinomics
- New technologies, behaviors, cultural forms that are taking advantage of scale
 - Multi-player online games
 - Wikipedia, blogs, community mapping
 - MyLifeBits project at MSR
 - London Travel Planning

Scale

Real Time Business

- Constant adjustment rather than fixed rules and prices
- Think of:
 - Numerous networks adjusting weights, prices, offerings, connections
 - New technologies that will automatically summarize information and place it into networks and hierarchies
 - The reach and range of "analytics" expands with data
 - Business, social, cultural

How Much Information Is There Anyway?

Findings from HMI? 2009

Roger Bohn Jim Short UC San Diego

http://hmi.ucsd.edu/ howmuchinfo_research_report_consum.php

What is HMI?

- A research program at UCSD and SDSC
- Our goal: create a census of the World's information
 - How much is there?
 - Of what types?
 - How is it created and where does it go?
- Measuring data and information
 - Inexact science
 - Assumptions and methods key

Consumers

Facebook, Twitter Stats

- Facebook
- Conventional Stats:
- 600,000,000+ users
- Half log in daily
- Average user: 130 friends
- Average session time: 23.3 mins per day
- Average user visits: 11.8 per month
- Core 18 to 24 year old segment growing 75% a year
- Over 250 million people access Facebook through their mobile phone

Twitter

Conventional Stats:

- 106,000,000 registered users
- 300,000 new sign up daily
- Average session time: 13.1 mins per day
- Average user visits: 10.2 per month
- 37% of registered users update their status through a mobile phone

How Much Enterprise Information Is There?

Findings from HMI? 2010

Jim Short Roger Bohn Chaitan Baru UC San Diego and SDSC Enterprise Server Informatio

Summary: How Many Bytes?

Table 1 World Server Information		
What is measured	World 2008 Total	Notes
Bytes processed plus delivered	9.57 zettabytes	
Bytes per worker per year per day	3.01 terabytes 12.0 gigabytes	3.18 billion workers in world labor force
Bytes per company per year	63.4 terabytes	151 million world businesses registered

Table 3: World Server Infor Server Class 2008	mation by			
	Entry-level	Midrange	High-end	Total
Total Bytes by Server	6.31	2.80	.451	9.57
Class				
(in zettabytes)				
adv UCSan Diego				SDSC - UCSI

World Server Summary Information

 IDC/EMC 2010 Total Digital Universe:
 1.2 zettabytes in 2010

 35 zettabytes by 2020

 Lyman/Varian 2003:
 18 exabytes of new information produced annually

 Rady UCSan Diego

Enterprise Information *Could Include*:

- Data delivered to workers screen-based
- Data stored on storage media (what about redundancy?)
- Data used (inputs & outputs to inform, to process something, to take action)
- Data in embedded processors in office & industrial machines

Our model:

"Information" = **Data** processed plus delivered for use Measured as: **Bytes** processed plus delivered by servers Servers = **World** installed base in 2008

Measuring "Work"

WORK WORK Performed by Servers We do not measure all workloads. But, our capacity measure accounts for all servers and we assume the workloads we do measure are representative of the whole

Measured

By

Assumptions:

Simulated workloads represent actual workloads

Estimating max server processing capacity for multiple workloads yields meaningful upper limit Industry Standard Server Benchmarks Where Each Benchmark Simulates One or More Enterprise Workloads

SDSC EUCSD

Measurement Points

UCSD © HMI? 2010 UCSD

sessions) for a typical Volume server in 2008; 300,000 user requests per minute. In bytes, 9.6 billion bytes per minute.

Total

VMmark Simulated Workloads

Six Virtual Machines = One VM Tile

Simulated Workloads:

Mail Server (Exchange mail server) OLTP Database (MySQL simulation) Web Server (SPECweb2005 design) Java Order Entry (TPC-C like)

Order of Magnitude:

Mail Server – 1,500 actions per minute Java Server – 17,500 new orders per minute In bytes, a typical Volume server processes approximately 1.8 billion bytes per minute for the 4 workloads measured

Test Server

VMs

Modeling Approach

World Server Sales 2004-2008

Annual World Server Sales

2004-2008

1

Current U.S. Dollars (in billions)

Server Class	2004	2005	2006	2007	2008	Total
Entry- level	\$24.4	\$27.3	\$28.5	\$30.8	\$29.3	\$140.5
Midrange	\$12.8	\$12.8	\$12.2	\$12.6	\$11.7	\$62.3
High-end	\$12.2	\$11.6	\$12.0	\$11.6	\$12.2	\$59.9
Total	\$49.5	\$51.8	\$52.8	\$55.1	\$53.3	\$262.7

COST ANALYSIS

- We used the detailed TPC-C pricing sheets to break down the costs of the System Under Test (SUT) into the cost of the Server Hardware and other components
- To accord with our server sales numbers, we recalculated price performance using only the costs of the server hardware (current dollars)
- Further cost performance (storage, network) analyses are possible and planned

New Way To Measure Capacity

- Aggregate capacity over very different kinds of servers
- Assume companies spend dollars for server capacity efficiently
- Measure capital cost per unit of benchmarked performance
- Then we translate different benchmarks into a common unit: bytes

Business Considerations Cloud Computing In the Era of Big Data

Cloud Potential Benefits

- C-level execs want to "press a button" to get more IT resources to meet dynamic needs
- CAPEX to variable OPEX
- Usage-based billing
- Launch speed and application agility
- Ease of maintenance and resource flexibility (free up IT staff to focus on business drivers)
- Energy efficiency

Cloud Concerns

- Suitability for needs defining appropriate workloads and applications
- Security and privacy (legal stays with owner)
- Availability, latency, reliability, performance, lack of reporting
- Data ownership and control (visibility, access)
- Interoperability (no standards)
- Vendor management (contracting, charge-back and sharing)

Rady UC San Diego School of Management

What Are People Doing Now?

- Prototyping / Proof of Concept
 - Setting up private clouds to test cloud performance
 - Web content and applications (web analytics)
 - Email and web collaboration (for large user bases)
 - Software as a Service (SAAS) peripheral processing, while keeping core functions (ERP) in the datacenter
 - Test and development rapid provisioning, unpredictable workloads
 - HPC economics of scale for very large data queries and massively parallel workloads

Cloud Top 10

• #1 Ownership

- Who in your enterprise "owns" cloud? Who is responsible for it? Is this agreed?
- #2 Cost
 - Who pays for cloud? (innovation is not cheap) Will users pay? Are you already using chargeback?

• # 3 Regulatory / Legal

 Is corporate legal involved and do they "get it"? You have responsibility for your data, not your services provider. Does legal have what they need to be effective partners in contracting and managing cloud service providers?

Cloud Top 10

• #4 Leveraging Cloud

 Is your company aggressive in rethinking its IT architecture with cloud? Will the potential benefits of be realized through effective implementation of visible cloud strategies?

• #5 Shared Infrastructure

- Underlying network and storage resources need to be shared.
- #6 Scalable
 - An effective cloud solution has to be scalable.
- # 7 Multi-Tenancy
 - Strong multi-tenancy involves extensive use of VLANs to isolate network traffic between different zones in the cloud.

Cloud Top 10

- #8 Chargeback
 - IT organizations must be able to create effective and accurate chargeback capabilities.

• #9 Define, Measure, Track Performance & Costs

 Since there are no standard tracking mechanisms used across cloud services, IT administrators will need to build or find ones appropriate to their circumstances

• #10 Implement Bottom Up, Manage Top Down

 Cloud involves a major change in how business users access and use IT resources.
